Online file sharing services aim to make it easy to store, sync and access the files you need, regardless of where you're working and which device you're using. If you want to be able to access a file you created on a PC while you're at the airport with your smartphone, just save it in a folder to be synced, and you'll be able to access it from any of your devices. You can also share files with friends and colleagues, and keep track of changes with version controls.

DISK IMAGING has rapidly become a must have tool for most users because of its convenience, speed, and altogether ease of use. With disk imaging software a user can safely recover their computer from a system crash or a bad virus infection without having to worry about reformatting and reinstalling the operating system. With drive imaging there is almost no reason at all to have to reinstall Windows because it offers you the ability to restore an image to your hard drive in a fraction of that time and accomplish the same thing while keeping all of your programs and important data. For many users this has made Windows backup and other file backup solutions redundant

FILE SYNCHRONIZATION utilities help you keep updated copies of files or folders in two or more locations, such as different computers, network drives, USB drives, or online storage. While a file sync utility could be used as a simple backup tool (called one-way syncing), its real power lies in keeping an identical set of working files in two or more locations
